- Battery powered – 9v battery included

VIGIL TEMPORARY FIRE ALARM

Our Vigil temporary fire alarm is the ideal construction site alarm – it's easy to install and even easier to use – and will alert a large area of an emergency. Available in two versions, either a push button or call point activated, it produces a very loud 110–decibel alarm and features a strobe light to raise the alarm in noisy environments.

Manufactured for Vigil Products, the battery–operated standalone fire alarm with strobe is supplied with a standard 9v battery and is suitable for installation on walls, trolleys or other structures. The push button version really is that simple and uses a twist action to silence the alarm, while the call point version uses the traditional method of raising the alarm which is reset with the key provided. Additionally, the call point version includes a clear cover which you lift to access to activate, which prevents accidental and malicious fire alarms.

Suitable for internal and external use, it's constructed of durable and weather–resistant ABS plastic with a red colour which makes it easy to identify. The construction site fire alarm is commonly found on temporary sites, buildings and events, as well as locations without a mains power source.

NOTE: Please test your site alarm activates when installing, and check regularly.
